

Complete database table report

120-day hackathon dataset | Clearly labelled synthetic records

This administrator report includes every SQLite table, every row and every column in one consistent snapshot. It includes all accounts and is intended for project review, not as a customer statement.

Snapshot detail	Value
Database	upay_hackathon.db
Tables / total rows	18 / 913
Transaction dates (Bangladesh)	2026-06-05 through 2026-10-02 (120 calendar days)
SQLite integrity / foreign keys	OK / no violations
Snapshot generated (Bangladesh)	2026-10-02T23:01:53+06:00
Exact snapshot attachment	database_snapshot.json (embedded in this PDF)
Attachment SHA-256	3dbcd651165f53e7dc8292990fc8f544db36a54767a79077b3dc3ef4843e482

Dates in raw database fields are stored UTC; the range above is converted to Bangladesh time (UTC+6). Monetary fields are labelled BDT and formatted to two decimals; the attachment preserves their exact raw values. NULL and empty strings are distinguished. Binary fields use complete base64. Wide tables share the same PDF row number across column groups so no fields are dropped.

Snapshot verification

The PDF is a readable view of the exact attached JSON snapshot. All source rows appear in each relevant column group. No SQL table, stored field, unsuccessful record or other account has been filtered out. The attachment preserves original SQLite numeric/string/null values and complete base64 for binary cells.

To extract the attachment

Open the PDF attachments panel in a compatible reader and save database_snapshot.json. Compare its SHA-256 with the cover value. Regenerate the report after database changes; this artifact records the state at its generation time.

Synthetic data provenance

Generated for the UpayX local hackathon prototype. This is not a real upay customer export and has no live bank, payment, credit or identity integrations. Demo fees, account records and financial terms illustrate project behavior. Backup files are recovery copies and are intentionally outside this database snapshot.
